TPC
10/13/05
Please amend claim 3 as follows.

3. (Currently Amending) A power-on reset circuit comprising:

a first capacitor connected between a power supply line and a first node;

a first MOS transistor connected between said first node and a second node, and

ON/OFF controlled based on a first pulse signal;

a second MOS transistor connected between said second node and a reference potential, and ON/OFF controlled based on a second pulse signal;

a second capacitor connected between said second node and said reference potential;

a timing control unit for generating said first and second pulse signals in synchronism with a clock signal externally applied thereto; and

an output portion outputting a reset signal when the potential of said internal node ~~an~~
internal node decreases below a threshold voltage after the application of a power supply
voltage to said power supply line.
